

## Plan Overview

---

*A Data Management Plan created using DMPTool-Stage*

**Title:** ASSESSMENT OF WATER QUALITY OF HOROOLO DRAIN

**Creator:** Arif Asghar

**Affiliation:** Non Partner Institution

**Principal Investigator:** Arif Asghar

**Data Manager:** Arif Asghar

**Funder:** National Science Foundation (nsf.gov)

**Funding opportunity number:** 3456

**Template:** NSF-AGS: Atmospheric and Geospace Sciences

**Last modified:** 01-24-2016

**Copyright information:**

The above plan creator(s) have agreed that others may use as much of the text of this plan as they would like in their own plans, and customize it as necessary. You do not need to credit the creator(s) as the source of the language used, but using any of the plan's text does not imply that the creator(s) endorse, or have any relationship to, your project or proposal

## ASSESSMENT OF WATER QUALITY OF HOROOLO DRAIN

The USGS will develop science-quality, applications-ready, time-series of key terrestrial variables and produce them on an operational basis using historical, current, and future Landsat observations. The terrestrial variables will follow the guidelines established through the Global Climate Observing System (GCOS) and include Climate Data Records (CDRs) that represent geophysical transformations of Landsat data (e.g., calibrated radiances, inter-calibration of Landsat instrument radiances, surface reflectance and surface temperature), and Essential Climate Variables (ECVs) that represent specific geophysical and biophysical land properties. CDRs and ECVs offer a framework for producing long-term Landsat datasets suited for monitoring, characterizing and understanding land surface change over time (Strategic Plan for Developing Landsat-scale Climate Data Records and Essential Climate Variables).

Therefore, the USGS Land Remote Sensing Program sets the following goals for the next five years:

1. Generate a surface reflectance CDR from calibrated Landsat 4-7 and future Landsat missions as a first step in transforming Landsat data into a time series for terrestrial monitoring.
2. Conduct research to develop and implement a technical approach to develop terrestrial ECV products of dynamic surface water extent (SWE), burned area (BA) and snow covered area (SCA).
3. Link this work to USGS terrestrial monitoring activities involving scientific assessments and decision support.

Nominal CDR production will generate surface reflectance products for every Landsat acquisition over the continental U.S. (CONUS) and Alaska from 1984 to the present. There are approximately 1,176,019 scenes archived at EROS from Landsat 7 Enhanced Thematic Mapper Plus (ETM+) and 603,863 scenes from Landsat 5 Thematic Mapper (TM). The total volume currently estimated for storing the raw Landsat pixel values, surface reflectance values, and ancillary quality information is 4.49 petabytes (PB).

The surface reflectance CDR derived from Landsats 4-7 Thematic Mapper (TM) and Enhanced Thematic Mapper Plus (ETM+) is produced using Landsat Ecosystem Disturbance Adaptive Processing System (LEDAPS) software baselined at EROS and currently running under version 2.2.1. Landsat 8 Operational Land Imager (OLI) surface reflectance is generated with a different algorithm to take advantage of that instrument's unique characteristics. All Landsat surface reflectance products share the basic specifications listed below.

Projection: Universal Transverse Mercator (UTM)

Format: Exelis Visualization (ENVI) binary (.img)

Pixel Size: 30-meter (m)

Temporal Coverage Landsat 4 TM: July 1982 to December 1993

Temporal Coverage Landsat 5 TM: March 1984 to May 2012

Temporal Coverage Landsat 7 ETM+: July 1999 to within one week of present

Temporal Coverage Landsat 8 OLI: April 2013 to within one week of present

Metadata for these products is generated in extensible markup language (XML) format for distribution with the data products, and follow Federal Geographic Data Committee (FGDC) standards. Metadata attributes are also embedded within the data product file headers. The field names in typical LEDAPS metadata are shown below, and are currently used to populate the discovery databases in EarthExplorer for product search and order.

<data\_provider>, <satellite>, <instrument>, <acquisition\_date>, <scene\_center\_time>, <level1\_production\_date>, <solar\_angles>, <wrs>, <lpgs\_metadata\_file>, <corner>, <corner>, <bounding\_coordinates>, <projection\_information>, <corner\_point\_location>, <corner\_point\_location>, <grid\_origin>, <utm\_proj\_params>, <projection\_information>, <orientation\_angle>, <bands>, <short\_name>, <long\_name>, <file\_name>, <pixel\_size>, <data\_units>, <valid\_range>, <calibrated\_nt>, <app\_version>, <production\_date>

As algorithms achieve provisional status, Surface Reflectance data products are available through EarthExplorer, under the “Data Sets” tab as “Landsat CDR.” The ESPA On Demand Interface also offers Surface Reflectance, in addition to Original Input Products and Metadata, Top of Atmosphere (TOA) Reflectance, and several Spectral Indices products: <http://espa.cr.usgs.gov>. Services such as reprojection, spatial subsetting, and pixel resizing are also available on that site.

All Landsat CDRs and ECVs are generated under intentions of perpetuity to support long term monitoring of land change. The only applicable restrictions to these collections are standard compliance to International Traffic in Arms Regulations (ITAR).

There are no restrictions on the re-use or re-distribution of the Landsat surface reflectance CDRs, as these products are intended for public use in the study of long term land change. The data providers simply request users include the following citation in publication or presentation materials based on these products to acknowledge the USGS as a data source, and to credit the original research.

*Landsat Surface Reflectance products courtesy of the U.S. Geological Survey Earth Resources Observation and Science Center.*

If possible, reprints or citations of papers or oral presentations based on USGS data are welcome at EROS User Services (<http://landsat.usgs.gov/contactus.php>). Such cooperation will help USGS stay informed of how the data are being used.

Landsat CDRs and ECVs are generated with the intention of providing long term data records for use in land change studies. The collections will be archived at USGS EROS under the same protocols for preservation as lower-level Landsat data. Once operational, these products will be publicly available through an on-line interface (EarthExplorer), and backed up on tape and external disk.

A digital presence for access to and information about the CDRs and ECVs is expected to be supported indefinitely through the USGS Land Remote Sensing Program, which will either host or provide links to relevant Web sites and documentation. So far, an Algorithm Description Document (ADD) and Product Guides are available to facilitate use of the data set ([http://landsat.usgs.gov/CDR\\_LSR.php](http://landsat.usgs.gov/CDR_LSR.php)).
