

Plan Overview

A Data Management Plan created using DMPTool-Stage

Title: Real-time cortisol monitoring for stress control

Creator: Hyeun Joong Yoon

Affiliation: South Dakota State University

Principal Investigator: Hyeun Joong Yoon

Data Manager: Hyeun Joong Yoon

Funder: National Aeronautics and Space Administration (nasa.gov)

Funding opportunity number: 16-16Omni2-0010

Template: National Aeronautics and Space Administration (NASA)

Last modified: 01-20-2017

You do not need to credit the creator(s) as the source of the language used, but using any of the plan's text does not imply that the creator(s) endorse, or have any relationship to, your project or proposal

Real-time cortisol monitoring for stress control

The primary data to be collected is sweat cortisol concentration measured by the cortisol sensor, in response to stressors on the human body. Patterns in the data will be analyzed for prediction of performance based on cortisol level. These data will be shown as (1) cyclic voltammetry (CV) in response to the cortisol concentration in human sweat; (2) real-time chronoamperometric (CA) responses to different cortisol levels; and (3) electrochemical characterization of the developed cortisol sensor. Another type of data to be retained is Matlab code and results from modeling, training, prediction, and calculation from the machine learning algorithms.

The raw data will be processed through the graphing and data analysis program Origin, and will be exported as PNG, JPEG, or PDF files. Investigators can capture the detail of the data by analyzing the recorded current or the voltage measurement shown as the text, or excel file format, which eventually will be processed into the PNG, JPEG, or PDF files.

Results/data from the research conducted will be shared in several ways. Manuscripts will be submitted for publication in high-quality peer-reviewed journals. Findings will be presented at relevant national or international conferences on biomedical, sensor, material, and chemistry research.

Data can be cited by referring to the published journal papers. Any researchers/teachers/students studying electrical engineering/chemistry/biomedical engineering will be interested in the data. If intellectual properties are generated, the policies and procedures of the South Dakota Board of Regents and South Dakota State University will govern data access and confidentiality. Once the necessary invention disclosures and/or provisional patents are filed, these data will promptly be disseminated to the scientific community.

The results and data to be shown in the journal papers will be publicly open to anyone without any time limits.

The working physical samples (e.g. cortisol sensor device) that generate data of interest for publications, presentations, and theses/dissertation will be kept in a special storage area in the PI's lab. The stored materials will be labeled with the name of the investigators who created the sample, as well as the sample's name, properties, and generation date. Physical samples will be preserved in the PI's lab for at least three years beyond termination of the award. Long term storage will involve exporting metadata stored within the JPG files (date, time, and tag information) into text files to facilitate access to the metadata and as a safeguard, should the specifics of JPG metadata structure change. The image files will be stored in a single zip file containing the date-hierarchical file structure.
