

Plan Overview

A Data Management Plan created using DMPTool-Stage

Title: Using weather and pollutant time series to analyze respiratory hospital admissions trends in South America

Creator: Fernando Fernandes

Affiliation: Non Partner Institution

Principal Investigator: Fernando Fernandes

Data Manager: Fernando Fernandes

Funder: Digital Curation Centre (dcc.ac.uk)

Funding opportunity number: 36290

Template: Digital Curation Centre

Project abstract:

Weather and pollutant concentration variations may have direct impact on human health. Subtle changes in weather or atmospheric conditions may increase hospital admissions for treatment on respiratory diseases like pneumonia or asthma, especially in risk groups such as elderly and children. This article proposes to analyze weather and pollutant concentration changes in the last ten years and add data from hospital admissions to identify patterns and trends. Time series data on air quality and pollutant concentration from government records on public hospitals are analyzed with big data technologies support and geographically visualized to provide researchers new insights. Also, regression models are proposed to predict new respiratory hospital admissions outcomes based on climate patterns

Using weather and pollutant time series to analyze respiratory hospital admissions trends in South America

Consolidation of 2 datasets

- CETESB - Brazilian Government Institution which provides data on air quality from a major city in Brazil, Guarulhos/Sao Paulo State.
 - Data Format: CSV - Needs consolidation of multiple pollutant into single table
- SIH-SUS - Public system specialized on hospital admissions that provides data such as diseases (ICD codes), and demographic data such as date of admission, date of death, age from patients and hospital information.
 - Data Format: DBC - Needs conversion to csv and consolidation with CETESB data

Software used

- Apache Hadoop - for data consolidation and summarization
- MS Excel - For computing moving averages on consolidated file

- Each file imported from government institution websites will be held in separated folders identifying institution. Besides, each file will identify institution and searched period.
- For versioning purposes, files will be appended with version number. A cloud repository such as GitHub may be used to control versioning.
- CETESB - Institutional web site - <https://qualar.cetesb.sp.gov.br>
 - Files will be renamed to concatenate institution, observational period, stationName and pollutant type and collection date timeStamp
 - Example:
 - CETESB_GuarulhosPaco_O3_JanDez2017_v1
 - CETESB_GuarulhosPaco_MP10_JanDez2017_v2
- SIH-SUS - Institutional web site - <http://www2.datasus.gov.br/DATASUS/index.php?area=0901&item=1&acao=25>
 - SIH-SUS files are mostly based, so files are provided without full information.
 - Files will be renamed to concatenate institution, month and year. Examples:
 - SIHSUS_0117_v1
 - SIHSUS_0217_v2
- Quality Assurance Measures
 - Revision of data to deal with missing and noise
 - Maintain separated files for individual pollutant measures and cross-checking with consolidated file

To understand the data, information on pollutant type, pollutant concentration, pollutant unit and date and hour of measurement is needed. This data is already presented in the columns on csv.

The Ecological Metadata Language may be used and metadata can be generated with a metadata tool such as Morpho.

- Access to data: data is already public and anonymized, so no legal rights are needed. There are no individual identification on medical records other than date of birth, death, ICD code and hospital.
- IP/IPR - As a principal investigator, I own the data. The data is free to use but citation on the original data is required.
- Data will be postponed to article publication acceptance.

Data will be stored in 2 sites.

- Local computer
- Company Servers with redundancy and backup routines
- The backup is already made in a daily manner for each sql server node.
- In case of incident, data can be recovered through restore from old files or tape disks.

- Data Security - Access is public due to be a public datasets.

No data should be destroyed due to all data be public.

All data will be preserved for future comparisons and other countries benchmark.

Future research may include time series comparisons in different countries.

Data will be retained in company data center, so it should be retained for long-term with no additional costs.

Alternatively, data may be sent to external repository such as datadryad.org with costs to the company.

A global repository may be used such as datadryad.org. This worldwide website includes datasets from different researches. Data will be able to be referenced via DOI number only after article publication.

Exclusive access is needed only for six months. Then data will be shared for any research purposes. A citation to original article and dataset is mandatory.

As a principal investigator with no partners, i will be responsible for implementing dmp and data management.

No external expertise are needed. All the hardware and software are already licensed and no renewal is necessary. Some charges may be applied to public repositories access such as datadryad.org.
