

## Plan Overview

---

*A Data Management Plan created using DMPTool-Stage*

**Title:** Covalent immobilization of antimicrobial peptides (AMPs) onto porous titanium oxide surfaces: a new strategy to fight infections and its impact on osteogenic and degradation properties of dental implants

**Creator:** Natália Costa

**Affiliation:** São Paulo State University (unesp.br)

**Principal Investigator:** Paulo Noronha Lisboa Filho, Natália de Araújo da Costa, Cristina Martins, Cláudia Monteiro

**Data Manager:** Paulo Noronha Lisboa Filho, Natália de Araújo da Costa, Cristina Martins, Cláudia Monteiro

**Project Administrator:** Paulo Noronha Lisboa Filho, Cristina Martins, Cláudia Monteiro

**Funder:** São Paulo Research Foundation (fapesp.br)

**Grant:** 20/10125-9

**Template:** Digital Curation Centre

**Last modified:** 10-02-2021

# Covalent immobilization of antimicrobial peptides (AMPs) onto porous titanium oxide surfaces: a new strategy to fight infections and its impact on osteogenic and degradation properties of dental implants

Text documents, figures, graphs and tables/spreadsheets as digital data.

The data will be collected or created from different characterizations (morphological, topographic, structural, chemical, and another types) or processing steps of the experimental samples.

The data will be organized into digital folders/files, being named according to the characterization technique performed and sample designation.

To ensure consistency and quality of data collection, processing and characterization protocols will be followed and sample replicates will be used.

Metadata will include the data title, ORCID ID of the responsible, date of creation, description of the experimental method, keywords, and financial support details.

Identity protection and/or approval from Ethics Committees are not needed to this project.

The data of this project can be used in future studies as long as its source is properly acknowledged.

Also, although it is not the main objective of this project, eventually some results which demand actions of Intellectual Property can be obtained. In this scenario, privacy and confidentiality will be ensured by the *Agência Unesp de Inovação (AUIN)*.

During research period, the data will be stored on different locations to significantly increase the chances for its recovery (if needed), which include personal laptops, computer hard drives, external storage devices, and cloud storage services, allowing both manual and automatic backup processes. Manual backups will be performed monthly.

All collaborators will have secure access to the data through passwords (confidential and non-transferable) and also by using controlled sharing functions provided by the cloud storage services.

All data will be preserved.

The data will be available as long as the institutional repository exists.

The data will be shared via institutional repository after its respective publication in scientific papers, or eventually after discussion and agreement in case of data under Intellectual Property actions.

There are no restrictions on sharing the data already published, except in case of data under Intellectual Property actions. In this last scenario, restrictions on data sharing will comply confidentiality agreements established.

The data management will be carried out by the responsible researchers for this project.

No additional resources are required to deliver this plan.
