

Plan Overview

A Data Management Plan created using DMPTool-Stage

Title: Transport and Magnetometer Measurements on Mechanically-Surface-treated NiS₂ Crystals

Creator: Sami El-Khatib

Affiliation: American University of Sharjah (aus.edu)

Principal Investigator: sami elkhatib

Template: Data Management Plan - AUS Funded Research

Project abstract:

This work focuses on the pyrite structure transition metal disulfide NiS₂, which has been studied for decades as an model antiferromagnetic Mott insulator, although many aspects of its electronic and magnetic properties have proven to be very difficult to understand. In essence, in this work we are planning to show that one of the main contributing factors to the confusion regarding the electronic properties of this material is the existence of *surface conduction*, which was ignored in almost all prior studies of this material. We use high quality single crystals, applying a spectrum of transport approaches and magnetometers that have not previously been applied to this material. The plan on this is to show that surface conduction *via* unique temperature dependence, thickness scaling, sensitivity to surface treatment, , and magnetoresistance measurements and analyses. While a couple of prior reports have provided *some* evidence for surface conduction in NiS₂, this project plan goes beyond those, clearly establishing this phenomenon and understanding its phenomenology in substantial detail.

In addition to the huge experimental work to execute this project, it takes into consideration training graduate students here at AUS considering his tuition fees and stipend for 2022/2023 academic year. My graduate student will be working on this topic, collecting transport and Magnetometer using Physical Properties Measurements system, XRD and EDS. The data on this topic is still under investigation, and in the main body of the project, I am showing some high quality results that will be combined with the data that we propose in this project for future publications

Transport and Magnetometer Measurements on Mechanically-Surface-treated NiS₂ Crystals

Data will be collected by using PPMS, EDS, and XRD to measure transport and magnetic properties of NiS₂ single crystals.

Data will be saved on data acquisition computer and will be backed up regularly using external hard drive.

There are no privacy requirements, data and analysis will be available to people in the materials laboratory.

Data will be shared internally to students and the PI. Data will be presented in conferences in a discussion way and exchanging ideas in preparation final version.

Data will be localized in PPMS computer and external hard drive with proper name and directory that are easy to access in the future.

Backing up data on different computers and external memory.
